Science Investigations

According to Dr. Bruce Alberts, former Editor-in Chief of Science magazine, “scientists share a common way of reaching conclusions that is based not only on evidence and logic, but also requires honesty, creativity, and openness to new ideas.” As a school with a strong focus on science, students leave Salk understanding that science is a way of making sense of the natural world through observation, experimentation, and an open and critical exchange of ideas. Additionally, students leave appreciating that science ideally is humanity’s attempt to make the world better for all living things and to ensure the health of our planet. Here are our students after conducting their own investigations and sharing them with our community in our all school science fair (Exploratorium) on May 14th. Selected groups presented at the Urban Advantage Science Expo at the American Museum of Natural History on Saturday, June 1st.
